

Rationale

AI-First Product Designer

07.06.2026 - Nada Amro

Why did I choose these scenarios?

I chose Finance because I was interested in the challenge of building trust in AI for high-stakes decisions. The goal was to design AI as a decision-support tool that improves efficiency while keeping humans in control of final approvals.

I chose HR because small HR teams are often overloaded with requests and administrative tasks. The goal was to use AI to reduce operational burden, surface the right information, and give HR professionals more time to focus on employees and meaningful human interactions.

What is the core UX insight behind each prototype?

HR teams spend too much time on administrative work instead of supporting employees. The design uses AI to reduce cognitive load, surface relevant information, and streamline workflows, allowing HR professionals to focus on people rather than processes.

Finance teams need speed without sacrificing trust. The design uses explainable, human-in-the-loop AI that provides insights and recommendations while keeping final decisions in human hands.

What would I do differently with another week?

- **End-to-end flow coverage:** Both prototypes demonstrate the primary happy path well. I would design edge cases such as when the AI is wrong, when a case has no clear resolution, or when an employee disputes a decision. These moments are where trust is built or lost.
- **Richer micro-interactions:** I would refine loading states, contextual empty states, undo actions, confirmations, and motion design to create a more polished and intuitive experience.
- **Deeper AI explainability:** I would provide greater transparency into how recommendations are generated by surfacing source documents, supporting data points, confidence levels, and clearer override mechanisms. Explainability is critical for user trust.
- **Usability validation and iteration**
- **Enhance UI Design:** Light interface that looks smarter.

Tools Used:

- Claude & Lovable – Used for ideation, content generation, planning, and refining project concepts.
- ChatGPT – Used for prompt writing, brainstorming, and drafting supporting content.
- Figma Make – Enhance UI design, animations
- Figma – Used to edit screens, refine layouts, and polish the visual design of the prototype.
